

Taxi Time Prediction for CDM

Laura Kang

John-Paul Clarke

**Massachusetts Institute of Technology
International Center for Air Transportation**

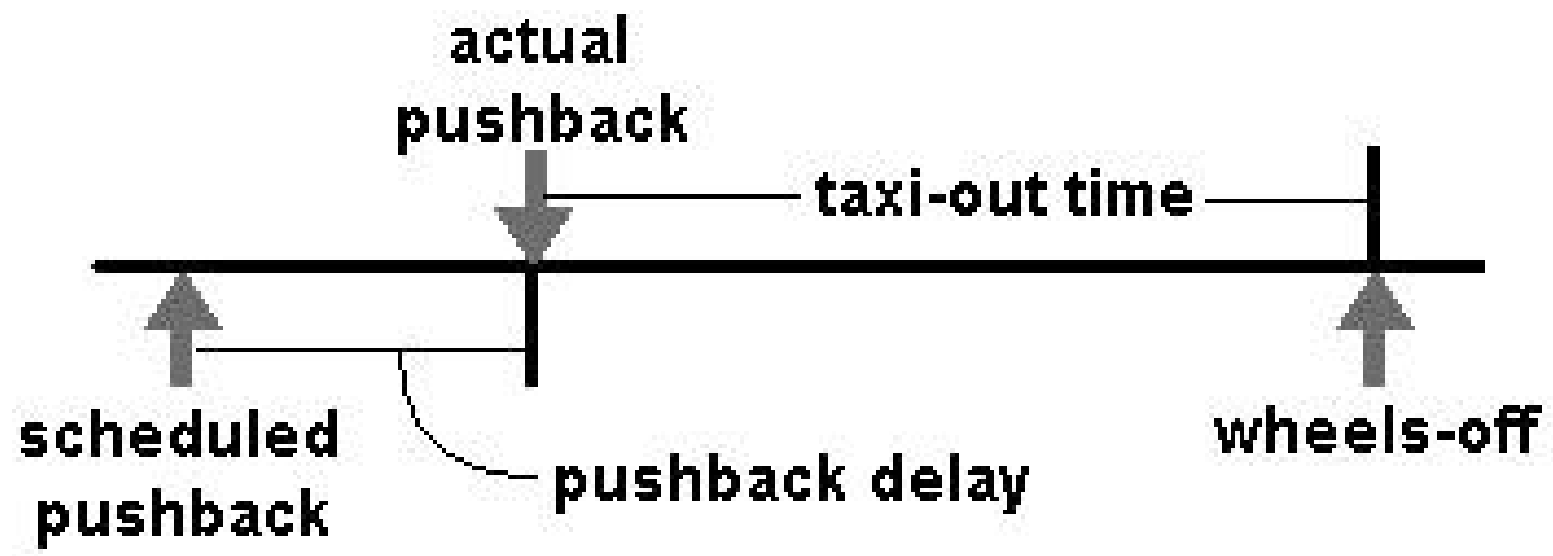

Introduction

- **Airline operations contribute to taxi delays**
 - Hub complexes create peaks in the demand for ATC services
 - Congestion impacts surface operations
 - Significant variation in taxi time
- **Taxi out time uncertainty creates uncertainty in arrival time estimates**
- **Results in inaccurate estimates of arrival demand**
 - Unused capacity
- **Need to improve taxi time estimates at congested airports**

Definitions

Pushback-Taxi Time Correlation

correlatoin
coefficient

Factor Analysis

- **Approach**

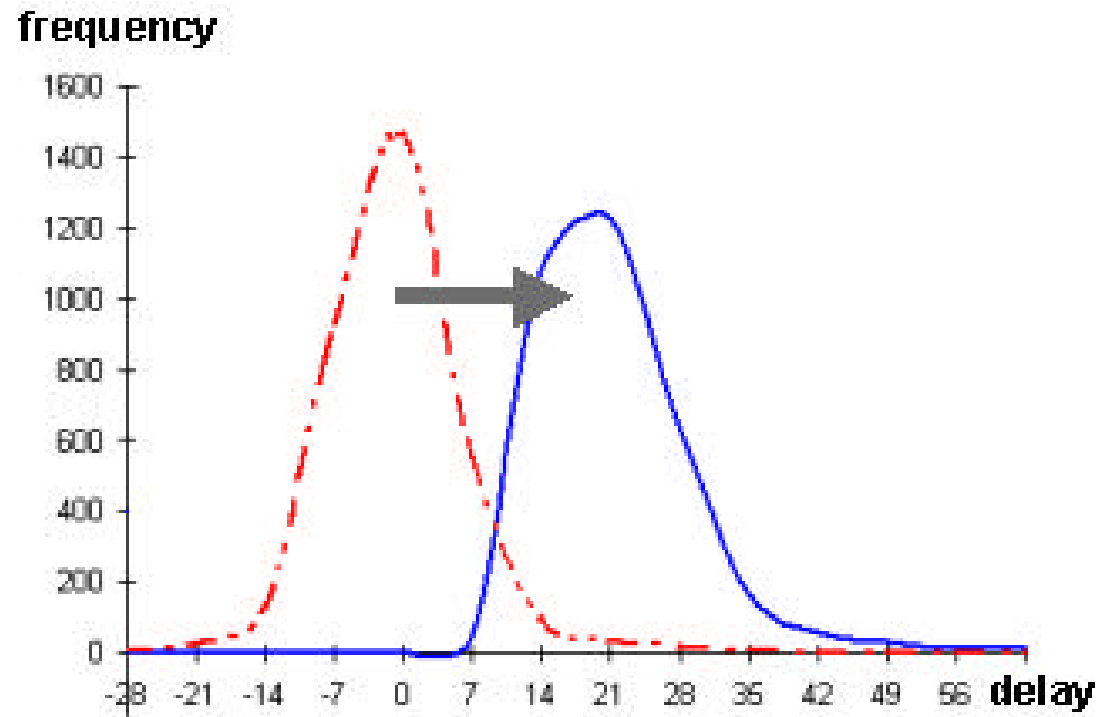

- Stepwise selection

- **Factors**

- Airline
- Terminal
- Time of day
- Day of week
- Fleet information
- Departure and arrival traffic
 - 10, 30, 60 and 90 minutes time windows which can represent all traffic at, before and after the scheduled pushback time
- Weather
 - 7 categories of weather reported in the Boston Globe

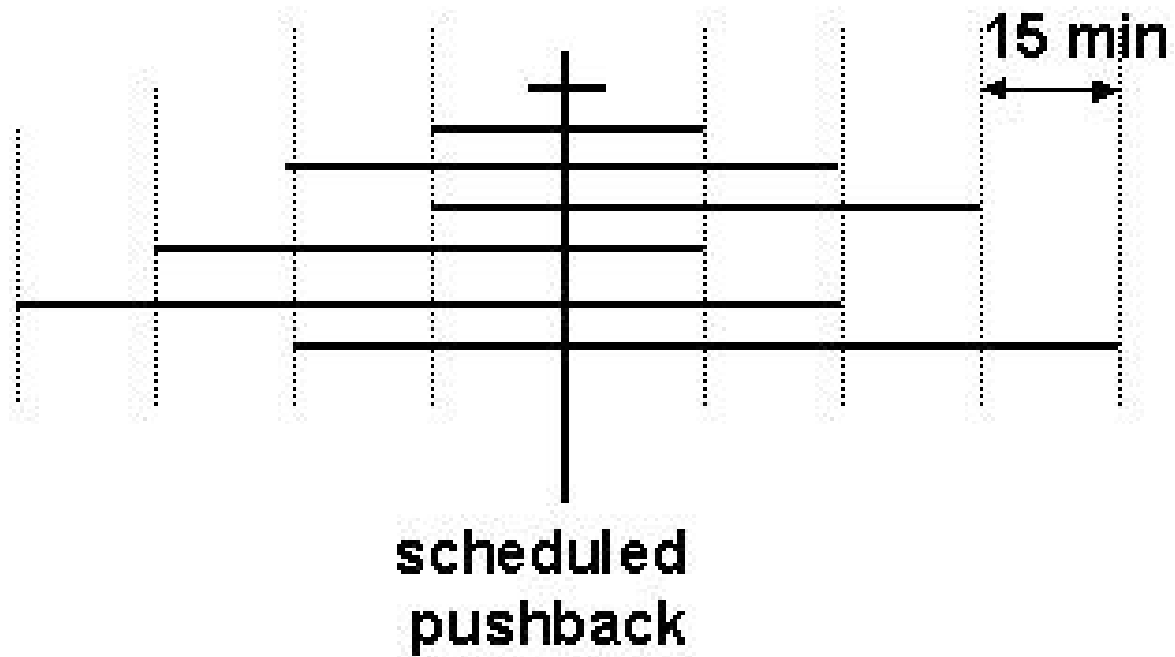

Model

Time Windows

BOS Case Study

- **Airport with significant taxi out times**
- **Distinct configuration characteristics**
- **Convenient**
 - Close
 - Data available
- **Impacted by weather**
 - Time of year effects

Case 1: July 1998; 27-22L/22L-22R

Case 1: Key Factors

- Terminal
- Weather
- Number of airplanes scheduled to be pushed back in 10 minute time window
- Traffic at the other terminal in larger time windows

Case 2: July 1998; 4L-4R-9/4L-4R

Case 2: Key Factors

- Airline
- Terminal
- Day of week.
- Traffic at terminal C
 - Terminal C (at the center of the primary taxiways) could create bottleneck for other terminals
 - Aircraft scheduled to be pushed back from terminal E take longer to taxi out because terminal E is the farthest terminal from the departure runways and because these aircraft must taxi past terminal C

Case 3: January 1998; 27-22L/22L-22R

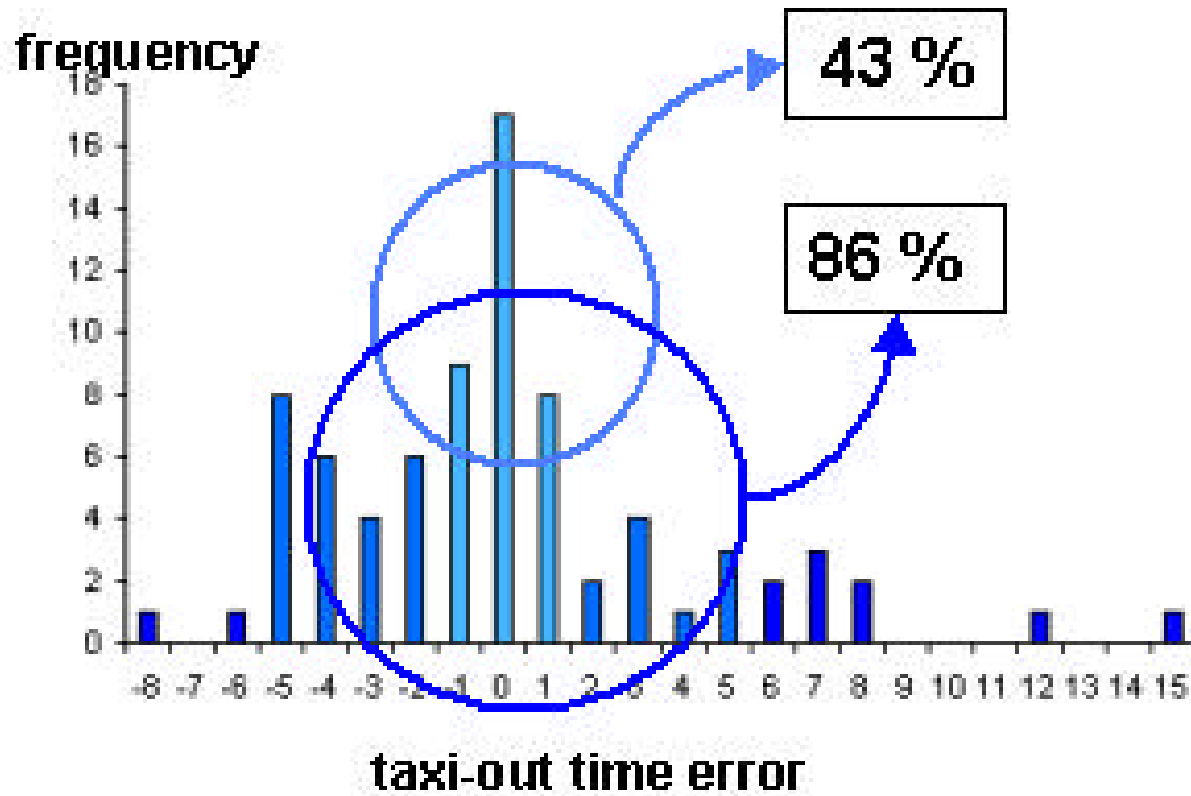

Case 3: Key Factors

- Fleet type
- Weather
- Long-term traffic demand
 - Traffic demand at terminal C is the most important
 - Traffic demand at terminal A is the least important

Comparison of Model to Actual Data

Summary

- **Taxi out time uncertainty creates uncertainty in arrival time estimates**
- **Results in inaccurate estimates of arrival demand**
- **Need to improve taxi time estimates at congested airports**
- **Factor analysis model used to determine key factors that affect taxi out time**
- **Favorable comparison of model to actual data**
 - 43% less than or equal to 1 min error
 - 86% less than or equal to 5 min error
