

#### **COTS** Tech Refresh and Maintenance

# NEXTOR 4th Annual Research Symposium

November 14, 2000 Virginia Stouffer

Logistics Management Institute 2000 Corporate Ridge McLean, VA 22102 www.lmi.org

## **Problem Statement**

- ¥ The FAA is increasingly using Commercial Off-The-Shelf (COTS) equipment in its air traffic systems automation, e.g.,
  - —STARS
  - —HOCSR
  - —DSR
  - —VSCS
- ¥ COTS equipment usually requires replacement or refreshment on a short time scale, shorter than the 20 year life-cycle the FAA enjoyed with custom-built systems
- ¥ What is the future maintenance and acquisition impact of this move to COTS?

#### Answer

 We researched industry, FAA, and DoD experience and found that COTS equipment follows a very predictable life cycle pattern, described in phases:

| Version on<br>market | Retail sale                                | Support   | Upgradability  |
|----------------------|--|---|--|
| 1                    | Product is the<br>current "new"<br>product | Manufacturer support often<br>free of charge                                      | N/A; product IS the<br>upgrade   |
| 2                    | Still buyable                              | Manufacturer support<br>available   | HW easily upgradeable;<br>SW makes automatic<br>adjustments  |
| 3                    | Not Available                              | Not supported by manufacturer; contractor support may be available                | HW requires new OS. SW<br>(OS) requires some<br>translation or bridge code<br>to take an older application |
| 4                    | Not Available                              | Support only from in-house<br>staff or long-term contract,<br>which may be broken | At some point, a new OS<br>emerges, requiring re-<br>coding to upgrade HW                                  |

## Definitions

- ¥ COTS: Any product offered for public sale
- ¥ Modified COTS: Any product offered for public sale that has been modified for the FAA; or for which the FAA is the only customer

LMI

## **Rules of Thumb**

- ¥ AUA Guide:
  - Each phase is 18 months long
  - Phase 1: Commercially available, with new product support
  - Phase 2: Follow-on release is out; support limited
  - Phase 3: OS is now 3 releases ago; possible to get independent contract support
  - Phase 4: Support unavailable anywhere at any price
- ¥ Alterations based on FAA program experience: PAMRI, VSCS, HOCSR, STARS
  - Phases vary in length
  - OS license fees apply
  - HW O&M and OS license fees face cost increases of 20% per year
  - Components reach an absolute physical end of life
- ¥ Supplement with industry rules of thumb, other data

## **Overall Model Capabilities**

- ¥ Provides a single model and interface to plan and estimate the costs of tech refresh
- ¥ Supports budget alternatives analysis
- ¥ Supports FAA-wide tech refresh cost estimating

| ct Program to Refresh  |  |                                    |                       |  |                           |                     |                  |                  |   |

## **Model Budget Capabilities**

- ¥ Allows input of actual funding streams
- ¥ Compares funding stream to funding requirements and implements schedule slips if funding falls below requirements
- ¥ Forecasts increased maintenance costs as a result of schedule slips
- ¥ Forecasts system-wide tech refresh costs over the next 20+ years

# **Model Cost Estimating Capabilities**

- ¥ Estimates program cost of tech refresh
  - —Program costs increase as refresh date is pushed further into the future
- ¥ Performs default budget estimating for cost estimators unwilling to specify a budget
- ¥ Estimates maintenance burden of refreshable systems

¥ Models systems or subsystems

# Essential Capabilities of the Model for the FAA

- ¥ Present inability to forecast tech refresh requirements
  - —baseline breaches
  - -re-baselining
  - —budget alternatives on the move
- ¥ Model has already shown how one refresh project should be expedited over another due to more quickly rising costs

### **Strategic TR Planning: Comparisons enabled by Model**

### **Maintenance Burden Forecast**

# **Computing CER Applied**

Note: original acquisition cost of STARS assumed to be \$1,327 M.

## FAA CER Areas

Computing - Accomplished in Phase I
