

Air Transportation System Limitations, Constraints and Trends

George L. Donohue

March 19-20, Wye Woods Conference Center

© George Donohue 2002

Demand has grown Faster than National Infrastructure

Relative Growth in Transportation Modes

Initial Observations and an Hypothesis

◆ **FACTS:**

- **Airspace above Airport Runway Thresholds (Operational Capacity) is a Limited, Nationally Allocatable Commodity**
- **National Airport and Airspace Management Infrastructure growth has seriously lagged behind Growth in Air Transportation Demand**
- **Utilization of this Capacity Commodity is Constrained by Airline Schedule Conflicts, Delay Tolerance, FAA Ground Delay Programs and Aircraft Safety (i.e. Aircraft Spacing)**

◆ **HYPOTHESIS:**

- **A DoT Supervised Auction System may be Required to Efficiently allocate Airport Capacity within Delay and Safety constraints**

Incentives for Operational Improvements and Modernization

Key Decision Points

- 
- ◆ **DP 1** **NATCA Contract Negotiations and Controller Mass Retirement Threat (Avg. Age=50 + Service=25) ~2007**
 - ◆ **DP 2** **Termination of Slot Controls - 2007**
 - ◆ **DP 3** **Sector Congestion and limits of Radio Frequency Spectrum Availability ~ 2010**
 - ◆ **Transition Barriers**
 - **Ground Based Infrastructure** **L---M---H**
 - **Airborne Equipment** **L---M---H**
 - **Labor Issues** **L---M---H**
 - **Regulation** **L---M---H**
 - **Required Culture Change** **L---M---H**
 - **Communication Bandwidth** **L---M---H**
 - **LACK OF INCENTIVES TO CHANGE !!!!**

Operational Capacity is a Limited Commodity

- ◆ $C_{MAX} = 2 C_{AR MAX} S \sum_i (XG)_i R_i \quad \{\text{Airports}\}$
 $-\sum_K A_K(t) \quad \{\text{Airspace Management Intervention}\}$
 - $S = f(\text{Safety}, \tau_{ATC}, \text{Wake Vortex, etc.}) \sim 0.6$
- ◆ $A_K(t) = (A/C_{REQUEST} - A/C_{ACCEPT}) \sim [0 \text{ to } >1,000]$
 - $A_K(t) = f(\text{GDP:Weather, Sector Workload Constraints})$
- ◆ $C_{AR MAX} \sim 64 \text{ Arrivals/Hour (set by Runway Occupancy Time)}$
- ◆ $R_i = \text{Number of Runways at } i^{\text{th}} \text{ Airport}$
- ◆ $XG_i = \text{Airport Configuration Factor at } i^{\text{th}} \text{ Airport}$
- ◆ $i = 1 \text{ to } N, \text{ where } N \text{ is approximately } 60 \text{ Airports}$
- ◆ $K = 1 \text{ to } M, \text{ where } M \text{ is typically much less than } 100 \text{ Sectors}$

Regional Distribution of Airport Infrastructure is Uneven

TABLE 1 Regional Air Transportation Capacity Fraction For (57) Major Airports

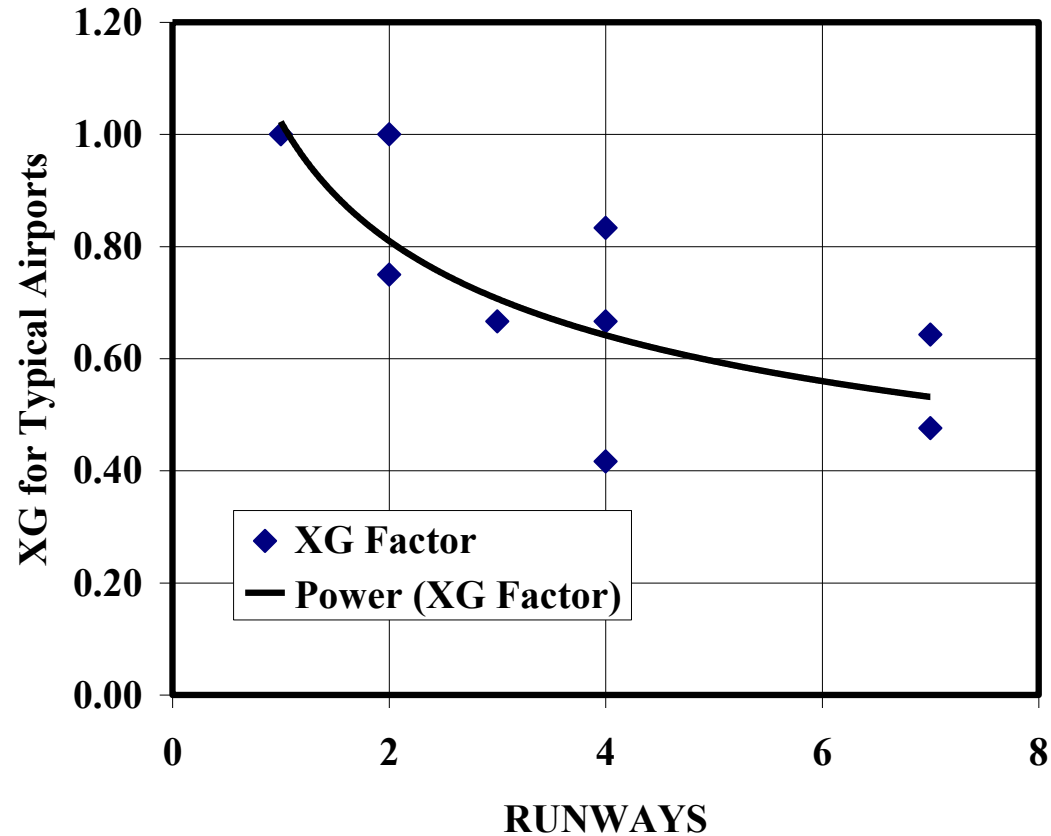

| REGION | NUMBER | Estimated | Number Ops/Hr | | % | Avg 8 yr | TAF | OPERATIONS | |
|-------------------------|------------|-------------|---------------|-------------|-----------|-----------|------------|-------------------|-------------------|
| | HUB | # A/C TURN | | | Cap97/ | Growth | 1997 ENP | | |

Airport Diseconomies of Scale

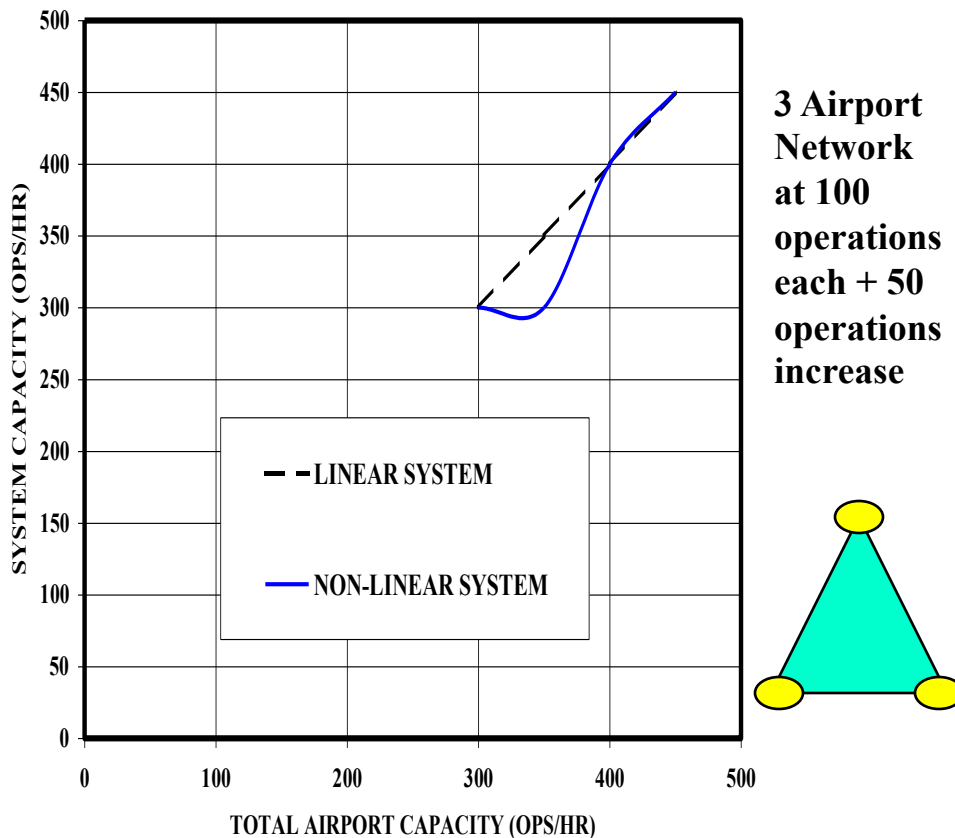

Airport Runway Diminishing Returns

Non-Linear Network Characteristics

EXAMPLE OF AIR TRANSPORTATION SYSTEM NON-LINEARITY

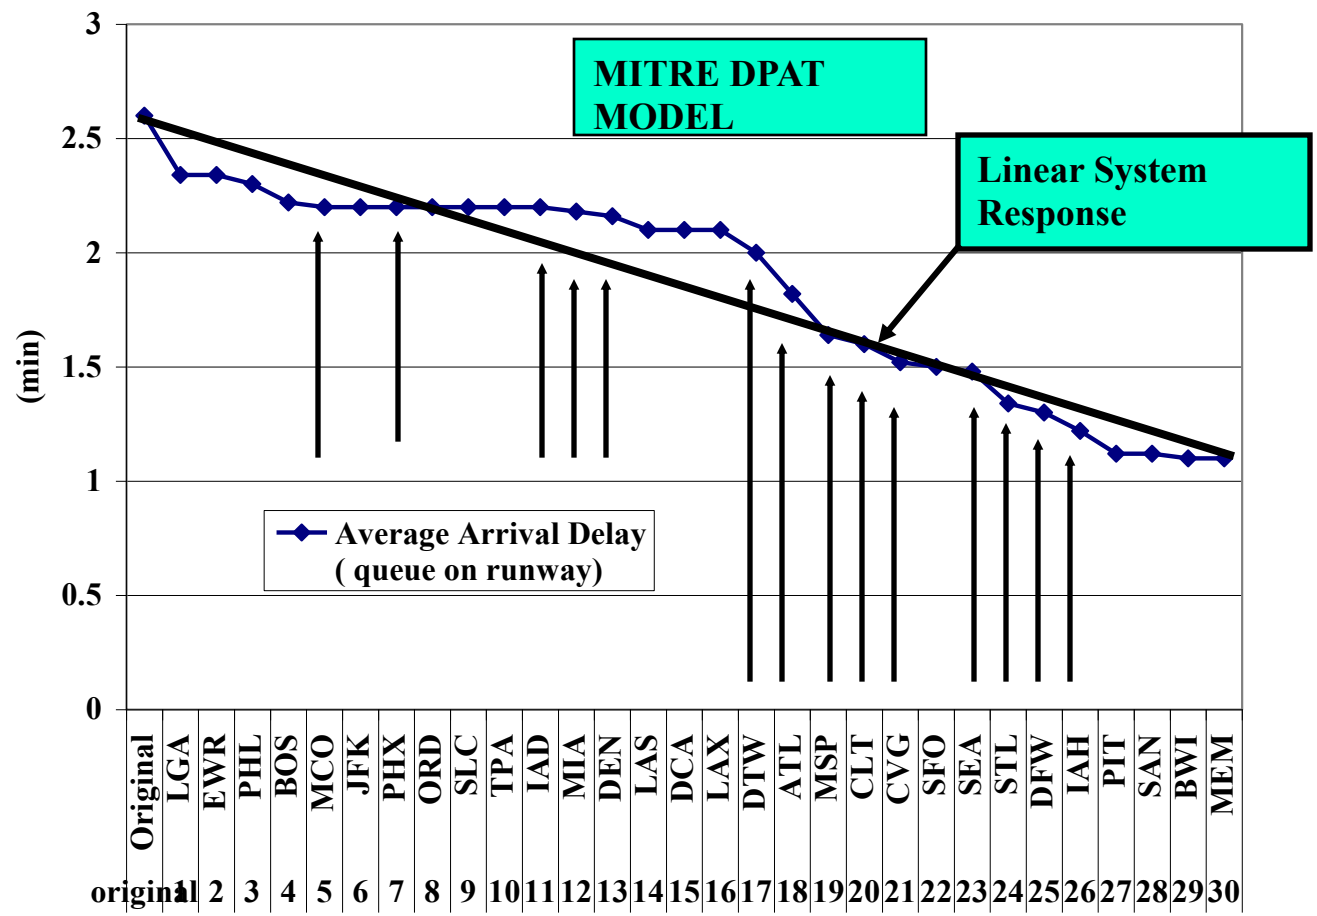

- ◆ **NAS is a Highly Non-Linear, Adaptive System**
 - **Controller-in-the-Loop**
 - **AOC-in-the-Loop**
 - **Independent Network Schedules**
- ◆ **Stochastic In Nature**
- ◆ **May exhibit Chaotic Behavior under Some Conditions**
- ◆ **Additive Improvements DO NOT result in Additive Increases in NAS Capacity**
 - **ie. pFAST, Runways, etc.**

Airline Schedule has a Strong Effect on Network Performance – Model Prediction to 20% Airport Capacity Increase

Outline

- ◆ Limitations on Air Transportation Capacity
- ◆ Safety, Capacity and Delay
- ◆ System Network Effects
- ◆ Future Security Effects
- ◆ **Observations** ←
- ◆ Future Vision

Observations

- ◆ **Approximately 10 of the Top US Hub Airports are Operating close to Maximum Safe Capacity**
- ◆ **Demand / Capacity Ratio's Greater than 0.7 lead to Very Rapid Increase in Arrival and Departure Delays**
 - **Higher Delays Lead to Loss of Schedule Integrity**
 - **25 New Runways Not a Solution**
- ◆ **Airline Hub and Spoke Network System Produces a Highly Non-Linear, Connected System**
 - **Weather, Security or Terminal Delays Propagate System Wide**
 - **Airline Schedules are part of the Problem & Solution**
- ◆ **ATC Sector Controller Workloads and Weather also Produce Network Choke-Points that Produce Capacity Constraints**

Observations (cont.)

- ◆ **100% EDS Baggage Screening will either Increase Delays or Travel Block Times for Commercial Ops**
- ◆ **Current Regulations on Airlines and Airports do not provide Incentives for either Safe or Efficient Operations**
 - **Airlines are over-scheduling Major Airports**
 - **ATC is spacing Aircraft at the limits of current technology leading to growing safety concerns**
 - **Airlines are moving to Smaller aircraft to increase frequency of operations and profitability, leading to increased congestion and delays**
 - **Airlines are resisting modernizing their aircraft with the technology required to decrease spacing and increase capacity**
 - **Incentives are to be last to equip**

Outline

- ◆ Safety, Capacity and Delay
- ◆ System Network Effects
- ◆ Future Security Effects
- ◆ Observations
- ◆ **Future Vision** ←

Vision: Incentives for Operational Improvements and Modernization

Brief Summary of Vision:

Major Hub Airports will Allocate Slots by DoT Auctions:

- Both Strategic, Near Term and Spot Auctions
- Peak runway loading will be reduced to Government Established Safety and Capacity optimized schedules
- Aircraft Size will be driven by a combination of airline profits and maximum enplanement opportunities

Business travel will migrate to Travel on Demand via air-taxi or private aircraft ownership and operation

Increased En-route Traffic density will be accommodated by Aircraft Self Separation-Technology-Equipped Flight Corridors

Auctions will provide incentives for aircraft technology insertion and a government contract to provide enhanced benefits
