# Toward Probabilistic Forecasts of Convective Storm Activity for En Route Air Traffic Management 

P. Barry Liu<br>Prof. Mark Hansen<br>University of California, Berkeley

September 25th, 2003

## Background

Weather is one of the primary factors in air traffic delay

(According to FAA, from Robust Dynamic Routing of Aircraft under Uncertainty, Nilim et al.)

## NEXTOR

## Background

$\square$ Current practice of ATM: the predicted storm zones are avoided completely.

## Background

## Unsatisfactory Forecast Performance $+$

Complete Avoidance of the Predicted Storm Zones
\|
Overly Conservative Routing Decisions
$+$
Much More Delays than the Unavoidable

## NEXTOR

## Background

- How about...take a less conservative route

## Background

- Dynamic routing strategies based on this concept were developed mostly under deterministic assumptions or in a simplified probabilistic setting
B But weather is stochastic in nature...
$\Rightarrow$ Investigate ways to provide probabilistic convective weather forecasts with higher accuracy in terms of convective activity probabilities for flight links to support realtime aircraft routing decision.

## Introduction

- Goal: provide a better prediction of convective weather in explicit probabilities defined specifically in the aircraft routing context to aid aircraft routing decision-making
$\square$ Approach: develop a stochastic model depicting the evolution of the convective weather
] Modeling framework: take the evolution of convective weather as a Markov process $\Rightarrow$ Future event can be predicted based on current information
$\square$ Markov Model
$\square$ Hidden Markov Model

## NEXTOR

## Markov Model

- First order Markov chain
- finite states (i.e. weather states)
- future state $S_{n+1}$, is independent of the past states and depends only on the present state $S_{n}$
- Transition probabilities

Pij

$$
\begin{aligned}
= & P\left\{S_{n+1}=j \mid S_{n}=i, S_{n-1}=i_{n-1}, \ldots,\right. \\
& \left.S_{1}=i_{1}, S_{0}=i_{0}\right\} \\
= & P\left\{S_{n+1}=j \mid S_{n}=i\right\}
\end{aligned}
$$

## Seeing isn't believing

$\square$ What we observe does not necessarily have 1-1 mapping on the state that the system is in -- the state of the system is hidden

- Example: deduce the weather from a piece of seaweed

$\Rightarrow$ Hidden Markov Model!

## NEXTOR

## Modeling Frameworks

$\square$ Markov Model

$$
\longrightarrow \quad \longrightarrow \quad \longrightarrow \quad \longrightarrow
$$

$\square$ Hidden Markov Model (HMM)

## NEXTOR

## Model Definition - Markov Model

- First-order Markov Model is fully characterized by the transition probabilities
E Example: Three states--State 1, State 2, State 3

| Transition Matrix |  | To | State 3 |
| :---: | :---: | :---: | :---: |
| From | State 1 | State 2 |  |
| State 1 | 0.5 | 0.4 | 0.1 |
| State 2 | 0.2 | 0.6 | 0.2 |
| State 3 | 0.1 | 0.4 | 0.5 |

## NEXTOR

## Model Development \& Prediction -

 Markov Model- Assume this is a discrete time Markov chain (transition occurs every $t$ minutes)
- Model parameters: the transition probabilities
- Estimate the parameters directly from the data (the maximum likelihood estimator)
$\hat{P}_{i j}=\frac{\# \text { of transitions from state } i \text { to state } j}{\# \text { of visits to state } i}$
$\square$ Prediction: Given the current states, the prediction for n periods later could be made by applying the transition probabilities n times

## NEXTOR

## Model Definition - Hidden Markov Model

- A HMM is defined by
- number of states
- initial state probabilities

- state transition matrix
- confusion matrix (emission probabilities)

|  | Confusion Matrix |  |  |  |  | Transition | Matrix |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $p(1 \mid *)$ | $p\left(\left.2\right\|^{*}\right)$ | $\mathrm{p}(3 \mid *)$ | $\mathrm{p}\left(4{ }^{*}\right)$ | $\mathrm{p}(5 \mid *)$ | p(Low ${ }^{*}$ ) | p(Med ${ }^{*}$ ) | $\mathrm{p}($ High \| *) | p(End $\left.\right\|^{*}$ ) |
| p(* Low) | 0.319 | 0.261 | 0.227 | 0.128 | 0.065 | 0.555 | 0.386 | 0.051 | 0.008 |
| p(* $\mid$ Med) | 0.117 | 0.168 | 0.277 | 0.282 | 0.155 | 0.353 | 0.302 | 0.314 | 0.031 |
| p(* \| High) | 0.115 | 0.133 | 0.291 | 0.263 | 0.198 | 0.12 | 0.417 | 0.432 | 0.031 |
| p(* $\mid$ Begin |  |  |  |  |  | 0.72014 | 0.15897 | 0.1209 |  |

## NEXTOR

## Model Development \& Prediction Hidden Markov Model

- Model parameters estimation (transition \& confusion matrices)
- Baum-Welch Algorithm
- Posterior probabilities - Forward \& Backward algorithms
- EM algorithm - maximum likelihood with missing data
$\square$ Determine current hidden state
- Viterbi Algorithm
- Given the output state sequence and the model parameters
- Determine the most probable state path
- Prediction
- Current state + confusion matrix => probabilistic prediction of future weather

## 

$\square$ Given: An output sequence: $\mathrm{O}_{0}, \ldots, \mathrm{O}_{\mathrm{n}}$
$\square$ Assume: the output sequence is generated by a HMM
$\square$ Objective function to maximize:
$\square \mathrm{P}\left(\mathrm{O}_{0}, \ldots, \mathrm{O}_{n}\right)$-- the log-likelihood of having this output sequence
$\square$ Hypothetical parameters / decision variables:

- Transition probabilities
$\square$ Emission probabilities
$\square$ Initial and end hidden state probabilities
$\square$ Techniques to estimate the model parameters:
$\square$ Calculate forward and backward probabilities recursively based on hypothetical parameters
$\square$ Estimate the parameters (based on multiple output sequences)
$\square$ Iterate till the objective function value reaches convergence

## Finding the most probable hidden state path (Viterbi algorithm)

- Given:
$\square$ An output sequence
$\square$ HMM parameters: Transition and Confusion matrices

Convective Activities

## Data Source

- MIT Lincoln Lab Corridor Integrated Weather System (CIWS) products
- Coverage: The Northeast Corridor in the United States $\sim 4$ million $1 \mathrm{~km} x$ 1 km cells, $\sim 700 \mathrm{k}$ valid cells

Coverage of sensors integrated in the 2002 CIWS demonstration.

## Data Source

C Convective weather states are labeled with Video Integrator and Processor (VIP) levels from 0 to 6

- VIP level $\geq 3$ : not flyable
$\square$ Data include both actual and forecasts

## NEXTOR

## Unit Area for Evaluation - Flight Link

Raw data: values for $1 \mathrm{~km} \times 1 \mathrm{~km}$ cells
A Assume en route flight speed $\sim 500 \mathrm{mi}$

- Dimension of unit area
$\square$ Length: distance traveled in 5 min . : $\sim 60 \mathrm{~km}$
$\square$ Width: flight path width: ~12km
- Strip level $=\max \left\{\right.$ cell level ${ }_{1}, \ldots$, cell level $\left.{ }_{60}\right\}$
$\square$ Band level $=\min \left\{\right.$ strip level ${ }_{1}, \ldots$, strip level $\left.{ }_{12}\right\}$

## A Case Study

## Implementation

- Data set: Aug 24, 2002, 46 time points, 5 minutes apart
- Coded in Java

$\square$ Steps:
$\square$ Determine the storm level for the flight links
$\square$ Define the hidden states and output states
- HMM parameter estimation using Baum-Welch algorithm
$\square$ Use Viterbi algorithm to find the most probable current state
$\square$ Use transition and confusion matrices to predict storm levels at future time periods (12 periods -- 1 hour)

## NEXTOR

## Implementation Decisions

- Number of hidden states: 3
- Number of output states: 5
- Seed matrices
- Stopping rule for algorithm iterations:

## Conc/usinns

D Need for properly defined probabilistic convective weather forecasts
[ Potential for Markovian models to provide such forecasts

- The states are defined in the context of airline application -- link-based states vs. cell-based states
$\square$ HMM shows promise in modeling convective weather in terms of performance and computation
- Further investigation using NHMM as modeling framework
- Future work to incorporate the convective weather forecasts in aircraft routing decision-making

## Questions?

Appendix

## Parameter Estimation for HMM

## Probability of observed data

- Computing of the observed sequence involves summing over many possible hidden state sequences:

$$
\mathrm{P}\left(\mathrm{O}_{0}, \ldots, \mathrm{O}_{n}\right)=\sum_{S_{0}, \ldots S_{n}} P_{\text {init }}\left(S_{0}\right) P_{e}\left(O_{0} \mid S_{0}\right) \ldots P_{t r}\left(S_{n} \mid S_{n-1}\right) P_{e}\left(O_{n} \mid S_{n}\right)
$$

## Forward updates

- Forward probabilities $\alpha_{t}(i)=P\left(\mathrm{O}_{0}, \ldots, \mathrm{O}_{\mathrm{t}}, \mathrm{S}_{\mathrm{t}}=\mathrm{i}\right)$
$\square \alpha_{0}(1)=P_{\text {init }}(1) P_{\mathrm{e}}($ heads $\mid 1)$
- $\alpha_{0}(2)=P_{\text {init }}(2) P_{e}($ heads $\mid 2)$
$\square \alpha_{1}(1)=\left[\alpha_{0}(1) \mathrm{P}_{\mathrm{tr}}(1 \mid 1)+\alpha_{0}(2) \mathrm{P}_{\mathrm{tr}}(1 \mid 2)\right] \mathrm{P}_{\mathrm{e}}($ tails $\mid 1)$
$\square \alpha_{1}(2)=\left[\alpha_{0}(1) P_{t r}(2 \mid 1)+\alpha_{0}(2) P_{t r}(2 \mid 2)\right] P_{\mathrm{e}}($ tails | 2)
- Generalized form:
$\square \alpha_{0}(i)=P_{\text {initit }}\left(S_{0}=i\right) P_{e}\left(O_{0} \mid S_{0}=i\right)$
$\square \alpha_{t}(i)=\left[\sum_{j} \alpha_{t-1}() P_{t r}\left(S_{t}=i \mid S_{t-1}=j\right)\right] P_{e}\left(O_{t} \mid S_{t}=i\right)$

## NEXTOR

## Backward updates

- Backward probabilities $\beta_{\mathrm{t}}(\mathrm{i})=\mathrm{P}\left(\mathrm{O}_{\mathrm{t}+1}, \ldots, \mathrm{O}_{\mathrm{n}} \mid \mathrm{S}_{\mathrm{t}}=\mathrm{i}\right)$

$$
\begin{aligned}
& \square \beta_{2}(1)=\mathrm{P}_{\mathrm{end}}(1) \\
& \beta_{2}(2)=\mathrm{P}_{\mathrm{end}}(2) \\
& \beta_{1}(1)=\mathrm{P}_{\mathrm{tr}}(1 \mid 1) \mathrm{P}_{\mathrm{e}}(\text { heads } \mid 1) \beta_{2}(1)+\mathrm{P}_{\mathrm{tr}}(2 \mid 1) \mathrm{P}_{\mathrm{e}} \text { (heads } \mid \text { 2) } \beta_{2}(2) \\
& \beta_{1}(2)=\mathrm{P}_{\mathrm{tr}}(1 \mid 2) \mathrm{P}_{\mathrm{e}}\left(\text { heads } \mid \text { 1) } \beta_{2}(1)+\mathrm{P}_{\mathrm{tr}}(2 \mid 2) \mathrm{P}_{\mathrm{e}}\left(\text { heads } \mid \text { 2) } \beta_{2}(2)\right.\right.
\end{aligned}
$$

$\square$ Generalized form:
$\square \beta_{\mathrm{n}}(\mathrm{i})=\mathrm{P}_{\text {end }}(\mathrm{i})$
$\square \beta_{t-1}(i)=\sum_{j} P_{t r}\left(S_{t}=j \mid S_{t-1}=i\right) P_{e}\left(O_{t} \mid S_{t}=j\right) \beta_{t}(j)$

## NEXTOR

## Forward-backward probabilities

Current estimate about $\mathrm{S}_{\mathrm{t}}: \alpha_{\mathrm{t}}(\mathrm{i})=\mathrm{P}\left(\mathrm{O}_{0}, \ldots, \mathrm{O}_{\mathrm{t}}, \mathrm{S}_{\mathrm{t}}=\mathrm{i}\right)$
Future evidence about $S_{t}: \beta_{t}(i)=P\left(O_{t+1}, \ldots, O_{n} \mid S_{t}=i\right)$
. The probability of generating the observations and going through state $i$ at time $t$ is:

$$
\mathrm{P}\left(\mathrm{O}_{0}, \ldots, \mathrm{O}_{\mathrm{n}}, \mathrm{~S}_{\mathrm{t}}=\mathrm{i}\right)=\alpha_{\mathrm{t}}(\mathrm{i}) \beta_{\mathrm{t}}(\mathrm{i})
$$

ㅁ $\left.\left.P\left(\mathrm{O}_{0}, \ldots, \mathrm{O}_{\mathrm{n}}\right)=\sum_{\mathrm{t}} \alpha_{\mathrm{t}} \mathrm{j}\right) \beta_{\mathrm{t}} \mathrm{j}\right) \quad$ for $\mathrm{t}=0,1, \ldots, \mathrm{n}$

- The posterior probability that the HMM was in a particular state i at time t is:

$$
\begin{aligned}
\mathrm{P}\left(\mathrm{~S}_{\mathrm{t}}=\mathrm{i} \mid \mathrm{O}_{0}, \ldots, \mathrm{O}_{\mathrm{n}}\right) & =\left[\alpha_{\mathrm{t}}(\mathrm{i}) \beta_{\mathrm{t}}(\mathrm{i})\right] /\left[\sum_{i} \alpha_{\mathrm{t}}(\mathrm{j}) \beta_{\mathrm{t}}(\mathrm{j})\right] \\
= & \left.x_{\mathrm{t}} \mathrm{i}\right)
\end{aligned}
$$

## Forward-backward probabilities

Current estimate about $\mathrm{S}_{\mathrm{t}}: \quad \alpha_{\mathrm{t}}(\mathrm{i})=\mathrm{P}\left(\mathrm{O}_{0}, \ldots, \mathrm{O}_{\mathrm{t}}, \mathrm{S}_{\mathrm{t}}=\mathrm{i}\right)$
Future evidence about $\mathrm{S}_{\mathrm{t}+1}: \beta_{\mathrm{t}+1}(\mathrm{j})=\mathrm{P}\left(\mathrm{O}_{\mathrm{t}+2}, \ldots, \mathrm{O}_{\mathrm{n}} \mid \mathrm{S}_{\mathrm{t}+1}=\mathrm{j}\right)$
[. The posterior probability that the HMM was in a particular state $i$ at time $t$ and transitioned to state $j$ at time $t+1$ is:

$$
\begin{aligned}
& P\left(S_{t}=\mathrm{i}, \mathrm{~S}_{\mathrm{t}+1}=\mathrm{j} \mid \mathrm{O}_{0}, \ldots, \mathrm{O}_{\mathrm{n}}\right) \\
& =\left[\alpha_{\alpha}(\mathrm{i}) \mathrm{P}_{\mathrm{tr}}\left(\mathrm{~S}_{\mathrm{t}+1}=\mathrm{j} \mid \mathrm{S}_{\mathrm{t}}=\mathrm{i}\right) \mathrm{P}_{\mathrm{e}}\left(\mathrm{O}_{\mathrm{t}+1} \mid \mathrm{S}_{\mathrm{t}+1}=\mathrm{j}\right) \beta_{\mathrm{t}+1}(\mathrm{j})\right] /\left[\sum_{j} \alpha_{\mathrm{t}}(\mathrm{j}) \beta_{\mathrm{t}}(\mathrm{j})\right] \\
& =y_{\mathrm{t}}(\mathrm{i}, \mathrm{j})
\end{aligned}
$$

## EM algorithm for HMMs

$\square$ Assume there are $M$ observation sequences:
$\mathrm{O}_{0}{ }^{(m)}, \ldots \mathrm{O}_{\mathrm{nm}}{ }^{(m)}$
$\square$ E-step: compute the posterior probabilities:
$\square x_{t}^{(m)}$ (i) for all $m, i$, and $t\left(t=0, \ldots, n_{m}\right)$
$\square y_{t}^{(m)}(i, j) \quad$ for all $m, i, j$, and $t\left(t=0, \ldots, n_{m-1}\right)$
$\square$ M-step:
$\square$ Initial state probabilities
$\square$ Transition probabilities
$\square$ Emission probabilities

## M-step: initial state probabilities

$\square$ Initial state probabilities
= expected fraction of times the sequences
started from a specific state i

$$
\hat{P}_{\text {init }}(i)=\frac{1}{M} \sum_{m=1}^{M} X_{0}^{(m)}(i)
$$

## NEXTOR

## M-step: transition probabilities

$\square$ Transition probabilities:

$$
\hat{P}_{t r}(j \mid i)=\frac{\# \text { of transitions from i to } j}{\# \text { of visits to } i}=\frac{\hat{N}(i, j)}{\sum_{j} \hat{N}(i, j)}
$$

where the expected number of transitions from $i$ to $j$ :
$\hat{N}(i, j)=\sum_{m=1}^{M} \sum_{t=0}^{n-1} y_{t}^{(m)}(i, j)$

## M-step: emission probabilities

$\square$ The emission probabilities:
$\hat{P}_{e}(k \mid i)=\frac{\# \text { of outputs } k \text { while in state } i}{\# \text { of visits to } i}=\frac{\hat{N}_{0}(i, k)}{\sum_{k} \hat{N}_{0}(i, k)}$
where the expected number of times a particular observation k was generated from a specific state i :
$\hat{N}_{0}(i, k)=\sum_{m=1}^{M} \sum_{t=0}^{n_{m}} x_{t}^{(m)}(i) \delta\left(O_{t}^{(m)}, k\right)$
where $\delta\left(O_{t}^{(m)}, k\right)=1 \quad \begin{array}{ll}\text { if } O_{t}^{(m)}=k \\ & =0\end{array} \quad \begin{array}{ll}\text { otherwise }\end{array}$

## NEXTOR

Video Integrator and Processor (VIP) Levels

| VIP Level | Reflectivity (dBZ) | Precipitation Description |
| ---: | :---: | :--- |
| 0 | $<18$ |  |
| 1 | $[18,30)$ | Light (Mist) |
| 2 | $[30,41)$ | Moderate |
| 3 | $[41,46)$ | Heavy |
| 4 | $[46,50)$ | Very Heavy |
| 5 | $[50,57)$ | Intense |
| 6 | $>57$ | Extreme |

## Sonпе peferences

- Robust Dynamic Routing of Aircraft under Uncertainty, Arnab Nilim, Laurent El Ghaoui, Vu Duong
- A Hidden Markov Model for Space-Time Precipitation, Walter Zucchini, Peter Guttorp, Water Resources Research, Vol. 27, No. 8, 1991
A class of stochastic models for relating synoptic atmospheric patterns to regional hydrologic phenomena, James P. Hughes, Peter Guttorp, Water Resources Research, Vol. 30, No. 5, 1994
- A non-homogeneous hidden Markov model for precipitation occurrence, James P. Hughes, Peter Guttorp, Stephen P. Charles, Applied Statistics, 48, Part 1, pp.15-30, 1999
- A gentle tutorial of the EM algorithm and its application to parameter estimation for Gaussian mixture and hidden Markov models, Jeff A. Bilmes, International Computer Science Institute, 1998
